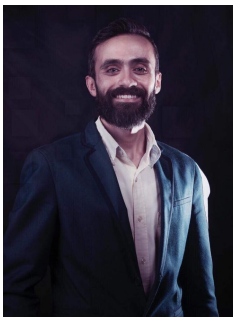
Speakers:

Associate Professor Hany Saber

Associate Professor of Pediatric Dentistry
Cairo University

Dr. Ahmed Shawky

Lecturer of Endodontics
Cairo University



Course Description:

Pulp therapy concepts show similarity in many aspects in deciduous and permanent dentition. However, due to some anatomical and morphological differences between deciduous and permanent teeth, these concepts are liable to some modifications. These modifications involve treatment techniques, the use of intra-canal medications, instrumentation procedures as well as filling materials and techniques. It is integral for pediatric dentists to be aware of the basic concepts and current techniques in pulp therapy to be able to deal with different clinical situations, especially in patients presented in the mixed dentition stage where the practitioner is dealing with both primary and permanent or young permanent teeth.

Hands on:

Practical training on rotary instrumentation in primary molars using the latest clinical protocol

By the end of this workshop, the candidate will

1. Have an updated knowledge about current techniques of pulp therapy in primary and permanent teeth
2. Have a clinical update about the treatment protocol in primary and permanent teeth.
3. Have the ability to select the proper materials for root canal filling in primary and permanent teeth according to the latest available evidence.
